

Case Heater Shield for 1130 and 1135 Modules

P/N: 04-11SCB-00

The outdoor modules of the 2537-1130-1135 atmospheric mercury speciation system require active case heating for proper function. The case heaters can be problematic for users during servicing due to inadvertent contact with the hot surface of the heater. Additionally, there is risk of the internal Teflon tubing from the sampling and zero air lines contacting the case heater and melting. To resolve these issues, Tekran has designed a Case Heater Shield (P/N: 04-11SCB-00) to prevent incidental contact. The case heater shield allows for sufficient heat dissipation and prevents sample line related issues. The Case Heater Shield clips directly to the exterior surface of the heating element – no tools are required for installation. Minimal contact with the element and open air design allow the shield to operate significantly cooler and offers additional safety.

Call Tekran today to order our new Case Heater Shields.
Your fingers will be glad you did!
