

## System Diagram Tekran Model 1130/1135 DataCom Option

### Tek-1130 Logging Program Operation

This program has the following features:

- Diagram Screen shows real-time temperature status. This allows you to log in to a remote system and see all the temperatures without having to be at the site.
- Logging of 2537A data in the same format as TekCap for Windows.
- Logging of 1130/1135 temperature controller temperatures (CAL Controller equipped systems only)
- Operator Log Book: Allows you to keep your operational logging information, and system maintenance, and other technical information related to operating your equipment right with the rest of your data. This feature is entirely optional, but might be helpful to you.
- Event History Log: A diagnostic log that contains information on the logging program's operation. Any software errors, or software events (such as detection of the 2537A sending a Low Carrier Flow message, indicating the system has run out of argon) are logged here.
- Trending: Logging of temperature data to disk for later charting.
