Date: August 2004

Tekran Inc. is pleased to announce that it has received ISO 9001:2000 certification. Over the last decade, Tekran has become a world leader in the design, development and manufacture of instrumentation to monitor mercury in the environment. Its Model 2537A analyzer has long been the de facto standard for ambient air mercury monitoring. More recently, positive results from long-term tests and permanent installations of its Series 3300 Continuous Emissions Monitor for industrial sources have placed it in a leadership position for power plant monitoring as well.

Company president Frank Schaedlich is quoted as saying:

“Tekran has long enjoyed steady growth as worldwide interest in mercury has increased. However, with the development of our new Series 3300 Mercury CEM, we foresee a period of explosive growth ahead as US coal fired power plants are forced to abide by pending EPA emissions regulations. The procedures put in place as a result of ISO registration will ensure that we will be able to maintain our high quality and excellent customer service in the face of this expansion.”
